

# MORE EXERCISES – HANGBOARD TRAINING GUIDE

**Dead Hang:** This is the fundamental exercise for developing contact strength. You

 Hangboard Training Guide exercises sketch

should master the dead hang on any particular hold before attempting any other exercise on that hold. Never lock your elbows completely. Always keep a slight bend to prevent injury.

**Bent Arm Hang:** A variation of the dead hang which will begin to develop your ability to pull through and lock-off. This can be done at any angle, and should be varied as much as possible. Pull yourself up to the designated angle and hold a static contraction for the designated amount of time. Be careful of doing maximal contractions at full lock-off, as they can be as injurious as fully locked-out elbows.

**Offset Hangs:** Begin as with the bent arm hang. Shift your weight all the way to one side and hold a contraction. Shift your weight laterally, all the way to the other side, without lowering your body and hold an equal contraction. Repeat. Vary the angle of your lock-off, the duration of your lock-off, and the number of repetitions.

**Pull-ups:** Try to be as smooth as possible. Don't jerk, kip, swing, or otherwise cheat. Keep your lower body quiet. Don't lock your elbows completely at the bottom. Focus on maintaining perfect form, and don't worry about the number of repetitions.

**Offset Pull-ups:** The first step to one-arm pull-ups. Position yourself with your weight centered under one arm, as if to do a one-arm pull-up. Choose a lower hold with the other hand and give yourself just enough assistance to complete the exercise.

**One-arm Pull-ups:** Now you really have some power! Follow the sa

me guidelines as for pull-ups but pronate your arm more. If you're getting close, but can't quite do one-arms, do an offset pull-up, but perform the negative contraction (lower yourself) as a pure one-arm. The potential for injury is very high, so it is absolutely critical to be smooth. Don't bounce!

**Front Lever:** Work up to these by performing them first with both legs bent at the knees, and then with one leg straight and one bent. If you can do a good front lever, try it with one arm.

**L-Hang:** The emphasis here is on core strength. Choose a hold that you're fairly comfortable on. You can dead hang or bent arm hang. Pull your legs up from the hips, keeping your knees straight and your toes pointed.

Hold a static contraction with your legs at 90 degrees to your torso or do slow repetitions raising your legs as far as you can but only lowering to about 45 below horizontal. If you lower your legs all the way, it will take the tension off your abs and constitute a rest. The idea is to keep your abdominal muscles contracted the entire time. If straight leg raises are too difficult, bend your knees at a 90 degree angle.

**Warning All Training Board Users:** Training on a hangboard carries risk of injury to fingers, arms, shoulders and the joints connecting them. Take every precaution to avoid damage to yourself; warm-up, stretch, don't overtrain and listen to your body. Remember, even under the best of circumstances, injuries can occur. In addition, however you mount your board, be sure that it cannot move in any direction. There should be no possible way for the board to come down while training.
